

GADS7331 - Part Two

High Concept Document

Ideation:

Skyrim is home to a form of randomly generated content in the form of the Radiant Quest system; a system that allows the generation of an “infinite” source of quests by using a mixture of different locations, goals, challenges, and more. It uses this system to add quests with the purpose of pacing unique faction-based questlines by adding activities the player must do before they can progress further with their faction of choice. While the Radiant Quest system gives the player an additional source of content to enjoy it does have limitations in the form of repetitiveness and after experiencing the dialogue for a radiant quest type once you will have experienced all versions of the dialogue for that quest type. The goal for this project is to experiment with different methods of improving the Radiant Quest system through dialogue so that while the player is doing the same thing repeatedly there is still some forms of variety even in the most repetitive activities.

LLM role:

The role of the LLM is to serve as the giver of “flavour text”. This is text designed to enrich the experience of a game event through the use of dialogue about the event. The LLM is to be fed dialogue prompts related to the quest by having the contents within a text file pasted into the text input box of the dialogue box with the LLM. Through the use of prompts certain data is to be ignored while key descriptors of the quest such as the type of item; the amount of it; and the name of the location the player needs to go to are prioritised for the LLM to focus on in order to give the best dialogue possible. While the LLM will be able to give dialogue to the player about the quest, it is just as possible the LLM will mention the object prefab’s index in the array rather than the name of the prefab itself. Through careful instructions within the text prompt we are able to steer both what the LLM speaks about but also the personality and role the LLM takes on.
